

AI Value & Readiness Workbook

A working session for turning an AI opportunity into an evidence-backed next step.

Start with one decision

Use this workbook with a business owner, a delivery lead and the people responsible for data and controls. Complete one copy per opportunity. Record unknowns explicitly; a blank is not evidence of readiness.

01 / Frame the opportunity

Business process, customer or colleague affected, and decision required:

02 / Name the people

Executive sponsor / process owner / technical lead / assessment date:

03 / Define the outcome

What should improve? Choose a primary measure and record its current baseline:

What you will leave with

A defined use case, a readiness evidence log, a bounded value case and a decision to investigate, pilot, defer or stop. This is a discussion aid; it does not certify readiness.

Suggested sequence: scope the problem, inspect the evidence, estimate value, then agree the smallest useful next step. Jengara | hello@jengara.ai

Define a useful opportunity

Describe the workflow before choosing a model, platform or agent.

Workflow today

Trigger, inputs, systems touched, decision points and current human effort:

Proposed intervention

What will AI do? What stays with a person? What action must never happen automatically?

Outcome	Baseline + source	Target + owner
Primary business measure		
Quality / acceptance measure		
Time / service measure		

Specify measurement units and observation period. If a baseline is unavailable, make measurement the first deliverable rather than estimating a benefit as fact.

Check delivery readiness

For each area, mark evidenced, partial or unknown. Add a source and an accountable owner.

Area + question	Evidence / status	Owner / next action
Data: are sources permitted, usable and maintained?		
Workflow: are exceptions and hand-offs understood?		
Integration: can systems expose the required interfaces?		
People: who accepts output and owns adoption?		
Controls: are access, oversight and recovery defined?		
Evaluation: what proves the output is acceptable?		

Constraint that most changes the decision
Record the missing evidence, how to obtain it and the decision it could change:

VALUE CASE / 04

Make the economics explicit

Use ranges where evidence is weak. Keep assumptions separate from measured observations.

Input	Estimate / range	Source / owner
Eligible monthly volume		
Current cost or time per unit		
Expected accepted-outcome rate		
Change in cost or value per outcome		
Build, integration and change cost		
Recurring technology + oversight cost		

Test the downside

Model lower adoption, more review effort and more retries. Avoid counting the same benefit twice, such as time saved and payroll reduction without a separate realization plan.

Sensitivity that matters most

Which assumption would remove the business case, and how will the pilot test it?

Agree the next evidence gate

Choose a bounded experiment with an owner, a spending limit and a stop condition.

Decision and rationale

Investigate / pilot / defer / stop. What evidence supports this choice?

Gate	Evidence required	Owner / date
Before pilot: permitted data and safe scope		
Before release: quality, oversight and recovery		
Before scale: realized value and operating owner		

First 30 / 60 / 90 days

Record the next three deliverables and the person accountable for each:

Keep the decision reviewable

Attach sources and assumptions. Review again when workload, data, architecture or business conditions change.
